

### **Easter Avenue at Verbena Street Storm Sewer Improvements**

This project is located northwest of Dry Creek Road and Yosemite Street. The drainage area to Easter Avenue is approximately 150 acres.

The existing storm sewer system is undersized, resulting in significant overland flows approximately once every five years. High velocity overland flows in excess of two feet deep knock down fences in route to Little Dry Creek, two blocks north of Easter Avenue. At Easter Avenue the runoff ponds to depths in excess of four feet.

This project will install additional inlets on the existing storm sewer system to optimize the runoff in the underground system. The construction of this project is planned to be done by SEMSWA maintenance personnel. The construction is scheduled for this spring/summer.

A master plan was recently initiated that will identify a permanent solution. The permanent solution project will need to be added to the CIP in a future year.
