

Panama Drive Drainage Just East of Broadway

This project is located 600 feet east of Broadway, approximately ½ mile north of Arapahoe Road. The drainage area is approximately 68 acres to the flood problem.

Currently the storm runoff ponds along Panama Drive until it is deep enough to flow to the Highline Canal. The path from Panama Drive to the Highline Canal includes flooding several residential and business structures.

This project would collect the runoff along Panama Drive and convey it in a storm sewer system north approximately 2,000 feet to an existing stormwater detention pond. The storm sewer system will include a crossing of the Highline Canal, since the Denver Water Board will not allow discharge increases into the Canal.
